PFAS testing for industries

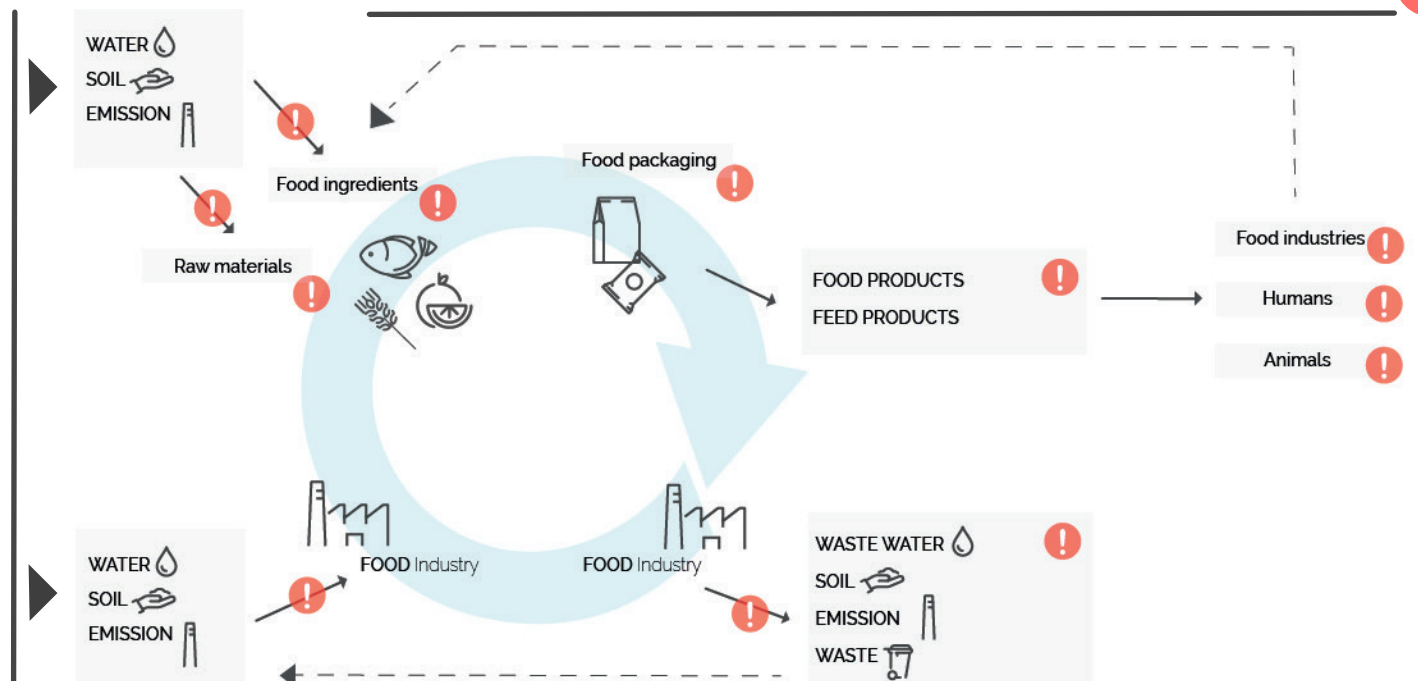

PFAS (per- and polyfluoroalkyl substances) are a family of nearly 5,000 synthetic chemicals manufactured since the 1940s, whose most "famous" compounds are **PFOS**, **PFOA** and their salts.

PFAS are persistent contaminants sometimes referred to as "forever contaminants" as their fluorine-carbon chemical bond - very useful in the industry for its stability and oil-repellent properties - is extremely difficult to degrade in humans and in the environment.

PFAS are dangerous to human health and to the environment.

PFAS can contaminate a wide variety of matrices: environment, water, soil, air, waste, food products, food-contact materials.

The several sources of PFAS CONTAMINATION

PFAS Services

by Mériex NutriSciences

- ▬ **Full testing on PFAS-contaminated matrices:** water, food products, food contact material, leachates, waste, others (air, emissions, soil, ect.).
- ▬ **Specific molecules for European and extra-European market:** GenX, PFHxS, etc.
- ▬ **International standard methods** (EPA, ISO, ASTM) **and internal methods**
- ▬ **Participation to dedicated working groups on PFAS and interlaboratory ring tests**
